Revenue & Commission Analytics Dashboard

Objective of the Dashboard

The objective of this dashboard is to analyze transaction-level revenue data and provide a structured view of:

- Total Gross Merchandise Value processed
- ERP Revenue generated
- Edviron Net Revenue retained
- Transaction volumes
- Monthly revenue trends
- Partner-wise contribution

The dashboard is designed to help understand revenue performance, partner dependency, and settlement exposure in a clear and decision-ready format.

Revenue Logic Used

The following revenue logic has been applied:

GMV (Gross Merchandise Value)

GMV represents the total transaction value processed through the platform.

Formula Used:
GMV = Sum of Transaction Amount (Order Amt / Transaction Amt)

This reflects the total payment volume handled.

ERP Revenue

ERP Revenue represents the revenue generated from ERP pricing layer applied on transactions.

Formula Used:
ERP Revenue = Sum of ERP_Revenue field

This is derived from the ERP pricing logic embedded in the dataset

Edviron Net Revenue

Net Revenue represents the final retained revenue after buying price and settlement adjustments.

Formula Used:
Net Revenue = Sum of Edviron_Net_Revenue

This reflects the actual earnings retained by Edviron

Assumptions:

1. Only successful transactions are considered for revenue calculations.
2. All monetary values are assumed to be in INR.
3. ERP Revenue and Net Revenue fields are considered accurate as per input file.
4. No duplicate Order IDs were included.
5. Settlement adjustments and pending exposures were not recalculated manually but taken from dataset fields.
6. Date grouping is done monthly for trend analysis.

Dashboard Design Rationale

The dashboard is structured in three layers:

KPI Summary

Top section shows:

- Total GMV
- Total Transactions
- ERP Revenue
- Net Revenue

Provide quick executive summary at a glance.

Monthly Revenue Trend

A pivot-based line chart displays:

- Monthly ERP Revenue Trend (2025)

Identify seasonality, growth spikes, and revenue concentration months.

Partner-Level Analysis

Partner-wise breakdown includes:

- Transaction contribution %
- Revenue share

- GMV contribution
- Net revenue retained

Understand dependency risk and concentration across partners.

Approach I followed

1. Raw CSV data cleaned and structured in Clean_Data sheet
2. Pivot tables created in Reports and Calc_Model sheets
3. GETPIVOTDATA used to dynamically link KPI values
4. Separate pivots used for charts and KPI stability
5. Currency formatting standardized (₹)
6. Dashboard structured for readability and executive reporting

Insights Observed

Revenue is heavily concentrated in a single partner.

1. Significant revenue spike observed in October.
2. Transaction growth trend aligns with ERP revenue growth.
3. Net revenue is a small fraction of GMV, indicating tight margins.

Conclusion

This dashboard provides a structured and scalable revenue analytics framework. It separates raw data, calculation logic, and presentation layer, ensuring Accuracy, Stability, Clean architecture, Executive-level readability. The model can be extended to include settlement tracking, margin analysis, and forecasting.
